```
The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an

                                                                                                                                                                                                                                                                                                                                                                                                                         use of staphylococcal enterotoxin(s) and homologues - for treating cancer in a patient or for the treatment of auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SEs) which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. SED was isolated and purified from S.aureus. It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SED. Synthetic polypeptides having structural homology to Staphylococal exotoxins are claimed, provided the homology to statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. See AAR13203-R13211
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating cancer with enterotoxin from Staphylococcus aureus administered by IV injection, having same tumoricidal activity Staphylococcal protein A without potential toxic reactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present suggestion is the process of several extractions, or suggestions agreed a staphylococcal enterotoxins, streptococcal pyrogenic sequence, between staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal enterotoxins (see ABB76234444). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal exterotoxin A and enterotoxin B, and to streptococcal pyrogenic exterotoxins, with statistically significant sequence homology and cannot similarity (Z value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting heematopoietic cells from a patient with a specific V beta subset of cells, and reintroducing these cells into the set in in vivo therapeutic, tumouricidal reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               126

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a parient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the protein sequence of staphylococcal enterotoxin D (SED). The invention provides novel conjugates (see ABPS8454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/E-120 (see ABPS8455), and an antibody moiety, such as tumour reactive antibody 574. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)

```
fragment is altered so that binding of the encoded altered toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHZ class II or T cell anityen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, peptide, diagnosing superantigen-associated bacterial infection, a vaccine (comprising an altered superantigen toxin peptide, diagnosing superantigen toxin for producing antigent comprising an altered superantigen toxin for a mammal against superantigen-associated bacterial infection, treating/ameliorating a superantigen-associated bacterial infection, an attenting/ameliorating a superantigen-associated bacterial infection, and an interest associated bacterial infection, an antibody which recognises altered TSST-1. Also disclosed are mutated staphylococcal enterotoxin A, B, C1 (SEA, SEC) and streptococcal pyrogenic enterotoxin a and b (SPEa and composition for treating or preventing bacterial infection. The present sequence represents the S. aureus enterotoxin E, SEE, MHC binding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    43 SDDQFLENTLLFKGFFTGHPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPN 102

                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the superantigens to MHC class II or T-cell antigen receptors. The producing vaccine against superantigen toxin effectiveness of Grugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                          and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating superantigen-associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the superantigens to MHC class II or T-cell antigen receptors. The present sequence the amino acid sequence of the bacterial superantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    43 SDDQFLENTLLFKGFFTGHPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPN 102

                                          The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHC class II or T cell antigen receptor is altered. Also included and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, (comprising a vector and an isolated and purified superantigen toxin, an altered Superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) superantigen toxin peptide, diagnosing superantigen toxin for producing antigenic and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, treating/ameliorating a superantigen-associated bacterial infection, and antiger a isolated from individuals immunised with one or more altered antiger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         09
                                                                                                                                                                                                                                                                       TSST-1 superantigen toxin and an antibody which recognises altered TSST-1. Also disclosed are mutated staphylococcal enterotoxin A, B, Cl (SEA, SEB, SEC1) and streptococcal pyrogenic enterotoxin a and b (SPEa and SFEb). The superantigen toxin DNA fragment is useful for preparing a composition for treating or preventing batterial infection. The present sequence represents the S, aureus enterotoxin A, SEA, MHC binding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 SHDQFLQHTILFKGFFTDHSWYNDLLVDFDSKDIVDKYKGKKVDLYGAYYGYQCAGGTPN

                                                                                                                                                                                                                                                                                                                                                                                                  107 MYGGVTLHDNNRLTBEKKVPINLWIDGKOTTVPIDKVKTSKKEVTVQELDLQARHYLHGK 166
                                                                               The present sequence represents a novel polypeptide, which is optionally expressed in NGIMB 4071. The polypeptide, and polymeulochide encoding it, are derived from Staphylococcus aureus. Cells expressing ligands binding the polypeptide can be used to isolated candidate compounds that bind and inhibit the activity of the polypeptide such compounds that used as anti-bacterial compounds. The polypeptide may also be used as an immunogen to vaccinate an animal for protection against Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the protein sequence of staphylococcal enterotoxin D (SED). The invention provides novel conjugates (see ABPS8454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA,E-120 (see ABPS6455), and an enterotoxins such as tumour reactive antibody 5T4. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintening biological activity and production levels. The novel conjugates were designed to
                                                                                                                                                                                                                                                                                                                                                                                                                             1 MYGGVTLHDNNRLTEEKKVPINLWLDGKXNIVPLETVKTNKKNVTVQELDLQARRYLQEK

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (1), nucleic acids encoding (1), ABM86044-ABN71526 and antibodies that bind (1) are used in the manufacture of medicaments for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.

The invention relates to pyrogenic toxins, such as staphylococcal enterotoxins, modified in the disulfide loop region.

the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            34 EMSSVGVINLRNLÝSTYDPTEVKGKINEGPPFSGSLFYKNI----PYGNSSIELKVELNS 89

New modified staphylococcal enterotoxin derived from a native disulfide loop-containing pyrogenic toxin, useful for non-specifically enhancing an immune function and as a vaccine against toxic shock syndrome or food
Typically, the modification involves deletions within the disulfide loop region of SEC (see AAY06261). The modified toxins retain useful biological properties, such as the ability to induce cytokine production, but have substantially reduced toxicity compared to the corresponding unmodified native toxin. Bmetic response inducing activity and fever inducing activity are typically decreased by at least about 100-fold, while LDSO (in Dutch Belted rabbits) is at least 100-fold higher than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            70 DLGSKDATNKYKGKKVDLYGAYYGYQC-----AGGTPNKTACMYGGVTLHDNNRLTEE 122

The invention relates to a modified pyrogenic toxin derived from a native disulphide loop-containing pyrogenic toxin where the modified toxin comprises a disulphide loop having no more than 10 amino acids. The modified toxin has a fever-inducing activity or an emetic response-inducing activity decreased by about 100-fold in comparison to a native toxin. The modified pyrogenic toxin, that is a staphylococcal enterotoxin, is useful for non-specifically enhancing an immune function and for vaccination against diseases such as toxic shock syndrome and food poisoning. This sequence represents the staphylococcal enterotoxin,

The invention relates to pyrogenic toxins, such as staphylococcal enterotoxins, modified in the disulfide loop region.

9
Typically, the modification involves deletions within the disulfide loop region of SEC (see AAY06261). The modified toxins retain useful biological properties, such as the ability to induce cytokine production, but have substantially reduced toxicity compared to the corresponding unmodified native toxin. Emetic response inducing activity and fever inducing activity are typically decreased by at least about 100-fold, while LD50 (in Dutch Belted rabbits) is at least 100-fold higher than the native toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New modified staphylococcal enterotoxin derived from a native disulfide loop-containing pyrogenic toxin, useful for non-specifically enhancing an immune function and as a vaccine against toxic shock syndrome or food

                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                             6
       The invention relates to a modified pyrogenic toxin derived from a native disulphide loop-containing pyrogenic toxin where the modified toxin comprises a disulphide loop having no more than 10 amino acids. The modified toxin has a fever-inducing activity or an emetic response-inducing activity decreased by about 100-fold in comparison to a native toxin. The modified pyrogenic toxin, that is a staphylococcal enterotoxin, is useful for non-specifically enhancing an immune function and for vaccination against diseases such as toxic shock syndrome and food poisoning. This sequence represents the staphylococcal enterotoxin,

o.
modification involves deletions within the disulfide loop region of SEC (see AAVGOS61). The modified toxins retain useful biological properties, such as the ability to induce cytokine production, but have substantially reduced toxicity compared to the corresponding unmodified native toxin. Emetic response inducing activity and fever inducing activity are typically decreased by at least about 100-fold, while LDS0 (in Dutch Belted rabbits) is at least about higher than the native toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               an

```
disulphide loop-containing pyrogenic toxin where the modified toxin comprises a disulphide loop having no more than 10 amino acids. The modified toxin has a fever-inducing activity or an emetic response-inducing activity or an emetic response-toxin. The modified by about 100-fold in comparison to a native notain. The modified pyrogenic toxin, that is a staphylococcal enterotoxin, is useful for non-specifically enhancing an immune function and for vaccination against diseases such as toxic shock syndrome and food poisoning. This sequence represents the staphylococcal enterotoxin,
   invention relates to a modified pyrogenic toxin derived from a
                                                                                                                                                                                                                                                                             SEC-4446

(TERM/) TERMAN D S.

Terman DS;

WPI; 2003-361759/34. N-PSDB; ACA64695. A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure; Page; 167pp; English

The invention relates to a mammalian cell receptor, useful in the

treatment of cancer, which binds to tumour associated lipids and induces an array or apoptosis in the T cells and antigen presenting cells (APCS).

Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour sesociated lipids and induces cellular inactivation or death is deleted or functionally deactivated producing (MI) a tumouricidal immunocyte population in vivo in a mammal to receptors for immunosytesire functionally deactivated by allowing tumour associated lipids contact immunocytes in which receptors for immunocyte population in vivo in a mammal cessoriated lipids and protecedly collipids are inactivated or sialylated glycans, lipopeptides and protecedly collipids are inactivated or subpractigen (SAS) nucleotide inserted into a virus, a mammalian T cell untitionally deactivated). A composition useful in the treatment of cancer comprising a lipid raft conjugated to a superantigen (M2) a tumouricidal immunocyte population ex vivo in a mammal (M3) a tumour associated lipids to context immunocytes, in which receptors for the lipids are inactivated or deleted to produce a tumouricidal immunocyte population ex vivo in a mammal (M3) a tumour associated lipids to context immunocytes in which receptors for the host), producing (M3) a tumouricidal lipids to context fumour associated lipids to context fractivated or deleted to produce a tumouricidally activated or deleted to produce a tumouricidally activated or deleted to produce a tumouricidally activated or deleted to produce a tumouricidally activated or deleted to produce a tumouricidally activated population or vivo in a mammal (M3) a tumour associated lipids are deleted or deleted or the host), producing a tumour associated lipids are deleted or the host), producing a tumouricidally a superantigen lipid after contact T cells and administration by tumour associated or deleted or tumouricidally activated or eleted or tumouricidally activated or eleted or tumouricidally activated or eleted or tumouricidally activat 171 NSDSFGGKVQRGLIVFHSSEGSTVSYDLFDAQGQYPD--TLLRIYRDNKTINSENLHIAL 228 203 BFNN--SPYETGYIKFIENENS-FWYDMMPAPGDGSKYLMMYNDNKAVDSKDVKIEV 259 85 LGNYDNVRVEFKNKDLADKYKDKYVDVFGANYYYQCYFSKKTNDINSHQTDKRKTCMYGG 144 111 VTLHDNNRLTEEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLY 170 sequence represents a bacterial superantigen protein (e.g. a staphylococcal enterotoxin). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from the US patnet office website at "seqdata.uspto.gov/sequence.html?DocID=20020177551" 1 SEKSEEINEKDLRKKSELQGTALGNLKQIYYYNEKAITENKESDDQFLENTLLFKGFFTG 60 27 AESOPDPRPDELHKSSKFTG-LMENMKVLYDDNHVSAI-NVKSIDQFLYFDLIYSIKDTK 84 tumours. Bacterial superantigens are co-administered or administered as fusion constructs with anti-tumour proteins or motifs. The present invention relates to a tumour cell capable of stimulating antitumor immure reactivity in vitro or in wive contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumor cell capable of stimulating antitumor immune reactivity in vitro or in vivo comprises exogenous nucleic acids encoding a superantigen and a costimulatory molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   62 PWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQC-----AGGTPNKTACMYGGV 111

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW64636-W64657 are peptides homologous to the amino acid sequence of a fragment of a pyrogenic exotoxin (PET), and derivatives of the peptide capable of eliciting protective immunity against toxic shock induced by PET or by a mixture of PETs. Such peptides are also capable of antagonising toxin-mediated activation of T-cells, inhibiting expression of pyrogenic toxin (PT) induced mRNA encoded by IL-2, IRN-gamma or TNF-beta genes. The peptides may be used to prepare therapeutics or vaccines for the treatment of prophylaxis of toxin-mediated activation of T cells and eliciting protective immunity against toxic shock induced by PETs. They can also be used for the treatment of harmful effects (especially food poisoning) and toxic shock caused by PET. Antiserum to the peptides can also be used for alleviating toxic shock induced by PET
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ----AGGTPNKTACMYGGV 111

This protein represents the Staphylococcus aureus type C enterotoxin SEC-MNCopeland. The invention relates to pyrogenic toxins, such as staphylococcal enterotoxins, modified in the disulfide loop region. Typically, the modification involves deletions within the disulfide loop region of SEC (see AAY06221). The modified toxins retain useful biological properties, such as the ability to induce cytokine production, but have substantially reduced toxicity compared to the corresponding unmodified native toxin. Emetic response inducing activity and fever inducing activity are typically decreased by at least about 100-fold, while LDSO (in Dutch Belted rabbits) is at least 100-fold higher than the
                                                                                                                                                                                                                                                                                                                                                                           SEC-MNCopeland; toxin; disulfide loop; protein engineering.

Nucleic acids encoding superantigens (see also AAN06738-39), esp. truncated forms of the superantigen lacking the leader peptide, and be utilised in the gene therapy of cancer, infectious diseases and immunological disorders. The nucleic acid, optionally in combination with cytokine or chemokine nucleic acid, is delivered to an animal using e.g. lipsoemes. It acts by controlling the activity of effector cells, such as T-cells, macrophages, monocytes and/or natural killer cells. Localised prodn. of an effective but non-toxic amount of encoded proteins allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  111

New modified staphylococcal enterotoxin derived from a native disulfide loop-containing pyrogenic toxin, useful for non-specifically enhancing an immune function and as a vaccine against toxic shock syndrome or food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a modified pyrogenic toxin derived from a native distulphide loop-containing pyrogenic toxin where the modified toxin comprises a disulphide loop having no more than 10 amino acids. The modified toxin has a fever-inducing activity or an emetic responsetowing activity decreased by about 100-fold in comparison to a native toxin. The modified pyrogenic toxin, that is a staphylococcal enterctoxin, is useful for non-specifically enhancing an immune function and for vaccination against diseases such as toxic shock syndrome and food poisoning. This sequence represents the staphylococcal enterctoxin, second

Typically, the modification involves deletions within the disulfide loop region of SEC (see AAYGÓSZI). The modified toxins retain useful biological properties, such as the ablility to induce cytokine production, but have substantially reduced toxicity compared to the corresponding unmodified native toxin. Enter response inducing activity and fever inducing activity are typically decreased by at least about 100-fold, while LDSO (in Dutch Belted rabbits) is at least 100-fold higher than the native toxin

The modified toxin has a fever-inducing activity or an emetic responsetinducing activity or an emetic responsetion activity decreased by about 100-fold in comparison to a native toxin. The modified pyrogenic toxin, that is a staphylococal enterction enterctoxin, is useful for non-specifically enhancing an immune function and for vaccination against diseases such as toxic shock syndrome and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disulfide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                         fragment is altered so that binding of the encoded altered toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHZ class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, peptide, diagnosing superantigen-associated bacterial superantigen toxin, peptide, diagnosing superantigen-associated bacterial infection, an animal against superantigen-associated bacterial infection, an animal against superantigen-associated bacterial infection, an aniser isolated from individuals immunised with one or more altered antisera isolated from individuals immunised with one or more altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1. Also disclosed are mutteed staphylococcal enterotoxin a and b (SPEa and SPEB). The superantigen toxin but was remeted staphylococcal enterotoxin a and b (SPEa and SPEB). The superantigen toxin by fragment is useful for preparing a composition for treating or preventing bacterial infection. The present sequence represents the Y94A (with reference to the mature protein sequence) mutant of SEB. Note: The present sequence is not shown in the specification but was created by the indexer using the wild-type sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8

                                                                                                                                                                                                                           Use of staphylococcal enterotoxin(s) and homologues - for treating cancer in a patient or for the treatment of auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             126 NLQNVLIRVY-ENKRNTISFE-VQTDKKSVTAQELDIKARNFLINKKNLYEFNS--SPYE 181
                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SEs) which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 69

The present sequence is the protein sequence of enterotoxin C3 (SEC3) of Staphylococcus aureus. Similarity is shown, in several stretches of sequence, between staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal exfoliative toxins (see ABB76234-44). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal enterotoxin A and enterotoxin B, and to streptococcal pyrogenic exotoxins, with statistically significant sequence homology and similarity (Z value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similar hydropathy profiles. These superantigens are used to treat solid tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoletic cells from a patient with come or more superantigens as vivo to generate stimulated cells, selecting a specific V beta subset of calls, and reintroducing these cells into the patient to induce an in vivo therapeutic, tumouricidal reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 123 --KKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEB was isolated and purified from S.aureus. It can be used for treating cancer, activating cytckine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEB. Synthetic polypeptides having structural homology to staphylococcal exctoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. See AAR13203-R13211

Use of staphylococcal enterotoxin(s) and homologues - for treating cancer in a patient or for the treatment of auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   112 TLHDNNRLTBEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYN 171
                                                                                                                                                                                                                                                  which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-WAR-2003 to correct PN field.)

A pair of nucleic acids comprising a portion of a long intergenic region (LIR) of a geminivirus genome lacking a sequence encoding a geminiviral coact protein, and a nucleic acid comprising a geminiviral replicase gene linked to a fruit ripening-dependent promoter, are new. Strains of Escherichia coli and Agrobacterium tumefaciens transfected with an expression vector containing the nucleic acids and a gene of interest are useful for the production of transgenic plants (or cells). The sequences and methods are useful for amplifying a gene of interest and overproducing a protein of interest in recombinant plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             110

The present sequence is the protein sequence of staphylococcal enterotoxin B (SEB) vaccine B42360210. The invention relates to a vaccine against superantigen toxin-associated bacterial diseases. Superantigen vaccines were developed by engineering changes in the receptor-binding portions of superantigen toxins such as SEB to reduce receptor-binding affinities and toxicity while maintaining antigenicity. In examples from the invention, attenuated superantigen toxins were shown to protect animals against challenge with wild-type toxin. Methods of producing and using the altered superantigen toxins as vaccines, and in diagnosis and therapy, are provided. A multivalent vaccine consisting of altered superantigen toxins from SEA, SEB, SEC-1, TSST-1 and streptococcal SPEa is predicted to provide protective immunity against the majority of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      144

fragment is altered so that binding of the encoded altered toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHC class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, producing altered comperantigen toxin peptide, diagnosing superantigen-associated bacterial infection, a vaccine (comprising an altered superantigen toxin port of a mammal against superantigen-associated bacterial infection, or treating/ameliorating a superantigen-associated bacterial infection, an antisera isolated from individuals immunised with one or more altered soft and solated from individuals immunised with one or more altered TSST-1. Also disclosed are mutated staphylococcal enterotoxin A, B, CI (SEA, SEB). The superantigen toxin DNA fragment is useful for preparing a composition for treating bacterial infection. The present sequence represents wild-type SEB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQC-----AGGTPNKTACMYGG 110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or C cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating superantigen-associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of staphylococcal enterotoxin B #1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

S-05-870-15
Application US/09870759
Patent No. US2002017551A1
GENERAL INFORMATION:
APPLICANT: TERMAN, David S
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATMENT OF NEOPLASTIC DISEASE
FILE REFERENCE: 870759
CURRENT APPLICATION NUMBER: US/09/870,759
CURRENT FILING DATE: 2002-01-14
PRIOR APPLICATION NUMBER: US 60/208,128
PRIOR APPLICATION NUMBER: US 60/208,128
NUMBER OF SEQ ID NOS: 166
SOFTWARE: Patentin version 3.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 HPWYNDLLVDLGSKDATNKYKCKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 120

Sequence 14, Application US/09870759

Patent No. US2002017551A1

GENERAL INFORMATION:

APPLICANT: TERMAN, David S

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATMENT OF NEOPLASTIC DISEASE

TITLE OF INVENTION UNMER: US/09/870,759

CURRENT APPLICATION NUMBER: US/09/870,759

CURRENT FILING DATE: 2000-01-14

PRIOR APPLICATION NUMBER: US 60/208,128

PRIOR PILING DATE: 2000-05-30

NUMBER OF SEQ ID NOS: 166

SOFTWARE: Patentin version 3.1

SEQ ID NO 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            86 LINFEDLLINFNSKEMAQHFKSKNVDVYPIRYSINCYGGEIDRTACTYGGVTPHEGNKLK 145
